# Sam Doe

(555) 555-0123 | sam.doe@example.com | linkedin.com/in/sam-doe-example | github.com/sam-doe-example
example.com/~sam-doe
Riverton, ST | Willing to relocate

## Education

**B.S. Electrical Engineering**, GPA 3.45/4.00 Expected Spring 2029
Example State University
**Relevant coursework:** Electrical Circuits, Digital Logic, Foundational Programming Concepts and Design
**Activities:** IEEE student branch

## Projects

**Weather Station with Wireless Logging** (ESP32, C, BME280, Python) Spring 2026

- Logged BME280 data every minute for 30 days over Wi-Fi and lost under 1% of samples
- Calibrated temperature in C against a reference thermometer at 20 points, to within 0.5 °C
- Wrote a Python plotting script that flagged gaps over 5 minutes and found 3 Wi-Fi outages

**4-Bit ALU on a Breadboard** (74HC logic, Logisim) Fall 2026

- Built a 4-bit ALU out of 14 74HC-series chips that can add, subtract, AND, OR and XOR, and checked it against a Logisim model for all 256 input pairs of each operation with DIP switches and LEDs
- Found 2 wiring faults in the carry chain by probing each stage with a logic analyzer

## Experience

**Electrical Lead, Example State Robotics Club**, Riverton, ST Aug 2026 – Present

- Designed and soldered a 2-layer power distribution board in KiCad with 6 fused outputs to replace the old hand-wired harness, so wiring before a match takes 45 minutes instead of 3 hours
- Traced controller resets on hard turns to a 1.2 V dip on the 5 V rail with an oscilloscope and gave the controller its own 5 V regulator, with no resets in the 12 matches since

**Barista, Example Coffee Co.**, Riverton, ST May 2025 – Present

## Skills

**Software:** C, Python, KiCad, Logisim
**Hardware/Lab:** Oscilloscope, Logic analyzer, Soldering, ESP32
